```
The present invention relates to an isolated nucleic acid encoding a melanoma differentiation associated gene-5 (Wda-5) polypeptide. Mda-5 contains a caspase recruitment domain (CARD) and a RNA helicase motif. Mda-5 is a novel interferon (IFN) inducible gene with structural similarities to RNA helicases and CARD motif containing proteins. Mda-5 is induced during terminal differentiation in human melanoma cells treated with the combination of recombinant fibroblast IFN and the antileukaemic compound mezerein (WEZ). Mda-5 is useful for identifying contourds that may induce its expression. Mda-5 is useful for reating cancer eg., melanoma, neuroblastoma, astrocytoma, glioblastoma multiforme, cervical cancer, breast cancer, colon cancer, prostate cancer osteosarcoma, chrondosarcoma and especially where the cancer is a cancer of the central nervous system and apoptosis. The Mda-5 promoter is exhibits melanocyte tissue specificity, and minimises systemic toxicity.
                                                                                                                                                                                                                                                                                                      encoding a Melanoma Differentiation Associated cell growth suppression, apoptosis and anti-viral
                                                                                                                                                                                                                   Gopalkrishnan RV;

from a subject with the expression level of the gene in a sample from healthy subject.

Claim 1; SEQ ID NO 156; 241pp; English.

The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises determining the expression level of a marker gene in a biological sample from a subject, comparing the expression level determined with the expression level of the marker gene in a biological sample from a healthy cubject, and judging whether the subject has bronchial asthma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (51) whose expression levels increase when respiratory epithelial cells are etimulated with interleukin-13, or (b) a group of genes (52) whose expression levels decrease when respiratory epithelial cells are stimmlated with interleukin-13. Also described: (l) a reagent (1) for cetimmlated with interleukin-13, or (b) a group of genes (52) a kit for screening for a candidate compound for a therapeutic agent cetimmlated with interleukin-13. Also described: (l) a reagent (i) for cetimmlated asthma or chronic obstructive pulmonary disease; (c) a minducer that induces bronchial asthma in a mouse; (5) a marker gene or an annial model for bronchial asthma or chronic obstructive pulmonary disease; (c) asthma or chronic obstructive pulmonary disease; (c) asthma or chronic obstructive pulmonary disease; (c) a marker gene or an antisense nucleic acid corresponding to a portion of the marker gene or an antisense nucleic acid corresponding to a portion of corresponding asthma or achronic obstructive pulmonary disease, on which a probe has been immobilised to assay a marker gene; on the method is useful for testing for or screening for a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The present corresponding or a procession of the gene through an RNAi effect or an antisathmatic activities, and can be used in gene therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The present corresponding for or screening for a therapeutic agent invention.

                                                                                                                                                                                                                                                                                                                                                                                                                         9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   80
                                                                                        The present sequence is the coding sequence for human RH116. RH116 is a list by protein and has homology to RNA helicases (DEXH box). RH116 and its coding sequence are useful for treating cancer; acute or chronic infections (especially by HIV or heatitis B or C); inherited genetic diseases; (auto)immune diseases (particularly rheumatism, arthritis, arterisoclerosis, esteoporosis and diabates, but many others listed) and opervent graft rejection. RH116 and its coding sequence are also useft for inducting, or increasing, the immune response to a vaccine
                                                                                                                                                                                                                                                                                                                                 MetSerAsnGlyTyrSerThrAspGluAsnPheArgTyrLeuIleSerCysPheArgAla

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; and actidity polymertides of the invention; and methods of identifying a compound which binds to a polypeptide of the invention in the invention further discloses methods of peventing, treating or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        901
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           921
```

c ameliorating a medical condition; kits comprising polynucleotide probes and/or monoclonal antibodies for carrying out the methods of the invention; methods for the identification of compounds that modulate the expression or activity of the polynucleotide and/or polypeptide; and 767 contig sequences corresponding to the CDNA sequences of the invention (ADC31384). The nucleic acids and polypeptides encoded by the contigs (ADC31362) and the polynpeptides encoded by the contigs (ADC31364). The nucleic acids and polypeptides of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the carists, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease. Alzheimer's disease and other neurodegenerative diseases, anemia, platelet diseases or concer. The nucleic acids may also be used as hybridisation probes or primers and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and an second supplements. The present sequence represents a specifically considered human CDNA sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was ftp.wipo.int/pub/published\_pct\_sequences. 

Sequence 3446 BP; 1184 A; 649 C; 772 G; 841 T; 0 U; 0 Other;
